Dear Suranjan Kuila,

Project: Student Attendance Management System
Decision: APPROVED_MINOR
Score: 88

Strengths:
The proposal presents a clear and well-articulated problem statement, directly addressing the inefficiencies of manual attendance tracking. The proposed solution is practical, with a comprehensive list of features that directly solve the identified issues, including essential functionalities like real-time analytics and persistent data storage.

Key OOP concepts such as Abstraction, Inheritance (with a clear example like Person/Student), Exception Handling, and Collections are appropriately identified and integrated into the proposed architecture. The layered object-oriented architecture (Data Model, Logic, UI) demonstrates a good understanding of separation of concerns, promoting modularity and maintainability, which is commendable for a university-level project.

Improvements:
While 'Polymorphism' is listed as an OOP concept, its concrete application within the system's features or architecture could be elaborated. For instance, explaining how polymorphism might be used (e.g., different types of users/reports) would strengthen this section.

For 'Persistent Data Storage,' specifying the intended mechanism (e.g., file I/O using serialization or CSV, or a lightweight embedded database) would provide a clearer technical direction.

The 'User Interface Layer' mentions the `Main` class. Clarifying whether this will be a console-based or graphical user interface would be beneficial, as it influences implementation details. Consideration of a testing strategy (e.g., unit tests for the Logic Layer) would also enhance the proposal's robustness.

Regards,
Course Instructor
